

The house memo

A portrait report written in markdown, in the same look as the decks

A sample built by this repo's own CI. It shows the features a memo can use.

THE SHORT VERSION

- **Write markdown.** Front matter gives the title block; the body is ordinary markdown.
- **Use the house blocks.** A summary box, numbered question cards, tables with a source line, and figures with captions.
- **Build and check.** `publishing build` writes the PDF beside its folder; CI runs `publishing check`.

What a memo holds

A memo is one markdown file, `memo.md`, in a folder named for its topic and version. Pictures and diagrams sit beside it. Reading text is set in Noto Serif; headings, tables and page furniture in Noto Sans; code in Noto Sans Mono. All three are vendored, so the page breaks the same way on every machine.

One tool, pinned by version in each repo. The repo owns its sources and PDFs.

Figure 1. One diagram, drawn in the house palette. Its text uses the vendored fonts because the build inlines local SVG files.

BLOCK	MARKDOWN	RENDERS AS
Summary	<code>::: summary ... :::</code>	a paper-toned box with a small heading
Question	<code>::: q</code> with a <code>###</code> heading	a card with an accent rule
Table source	a paragraph starting <code>:</code> after a table	a small grey line under the table
Figure	an image alone in its paragraph	the image with its caption
New page	<code>## Heading {.newpage}</code>	the heading starts a new page

Source: the publishing markdown reader

Code is highlighted in the house palette:

```
# docs/report.toml
publishing = "0.1.0"
project = "Fleet"
```

Questions

1. Is a memo the right format?

Use a memo when the reader reads top to bottom; use a deck when the argument is a sequence of pictures.

Recommendation. A memo for plans and audits, a deck for designs and findings.

What the answer changes. Which `publishing new --format` the author starts from.
